The role of nutrition, especially in the middle school child’s life is very important because they’re making some nutritional decisions that will probably last for the rest of their lives, things that they chose to do at that age of middle school will probably be with them for the rest of their lives. Also, at the middle school age is the time that many individuals are going through puberty, so a lot of growth spurts are occurring. So again, bones are expanding, and so the amount of calcium and vitamin D that we’re taking in on the diets really do impact the quality of just their overall body structure. So again, that nutrition that you’re choosing to put in and what you’re choosing to eat at specific lunch periods, for example, really can make a difference. We’re putting into a bank account if you will. What you’re choosing to do at middle school, you can take out later in life and draw on that bank account that you made the deposits in during middle school through the nutritional choices that you made.
